Group memebers

1)G.S.E Aponso(24176)
2)**G.A.S Pankaja(24598)**

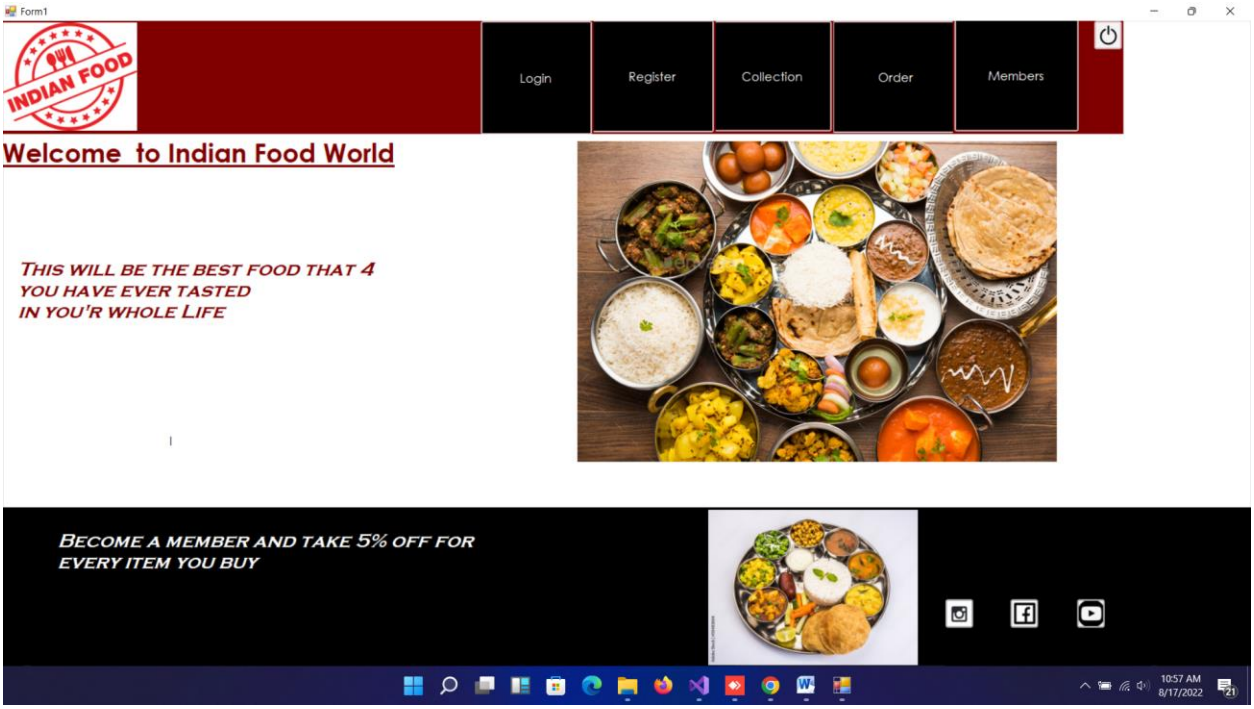
3)RMKM Rathnayake(24826)

4)C.k Jayasinghe

5) T.H.A Nadeeshan(24649)

6)K.W.M.L Arunasiri(24384)

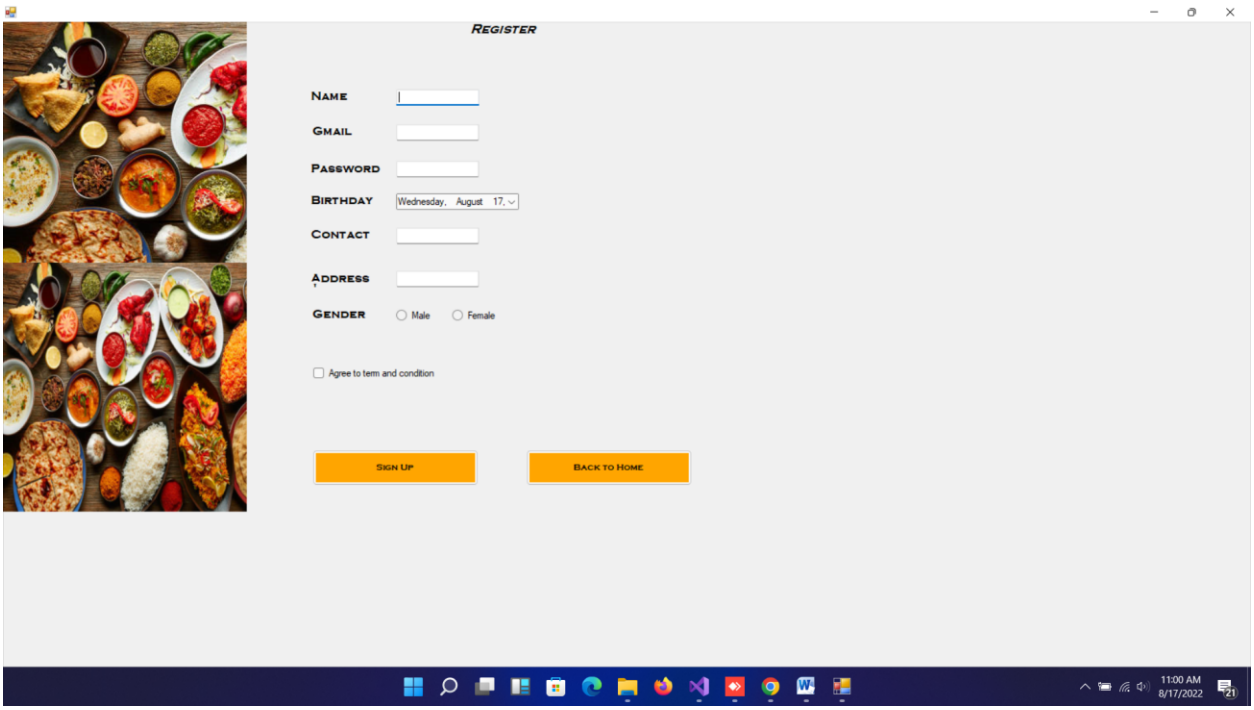
How this Application works
==========



This is the first interface that user will get when the user opens the application.

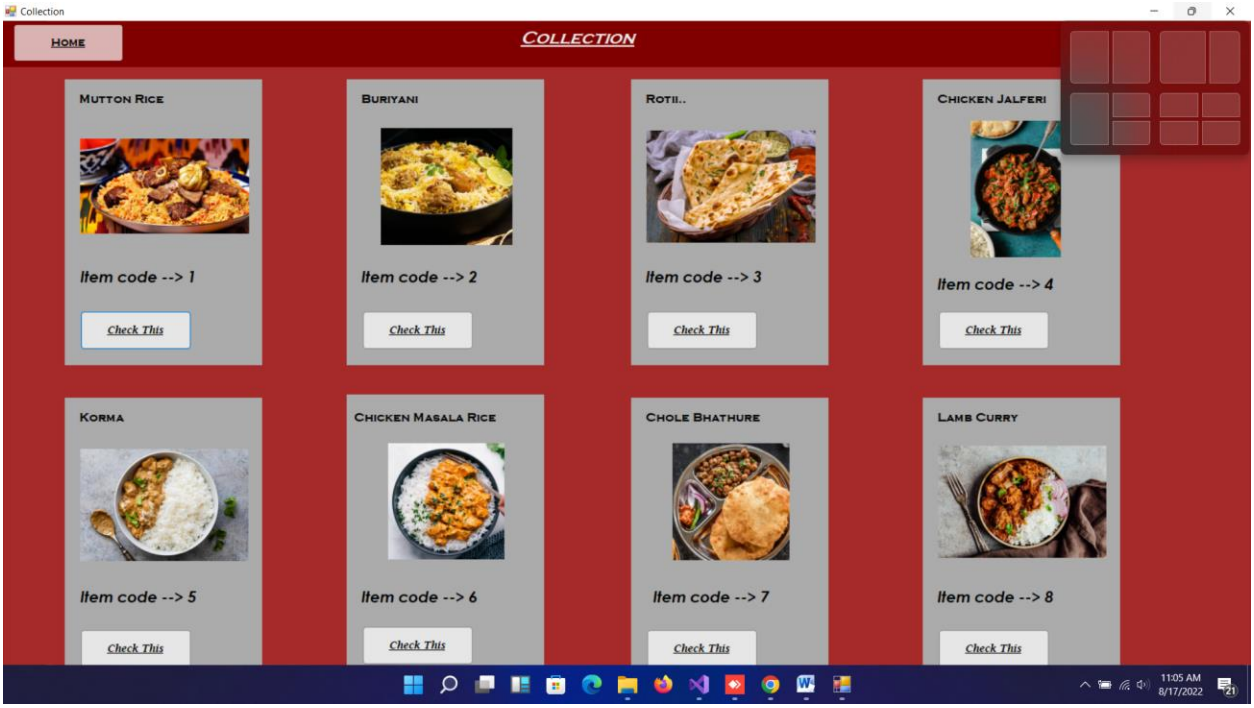
The user will be able to select whaterver the tab he wants to visit on.

I

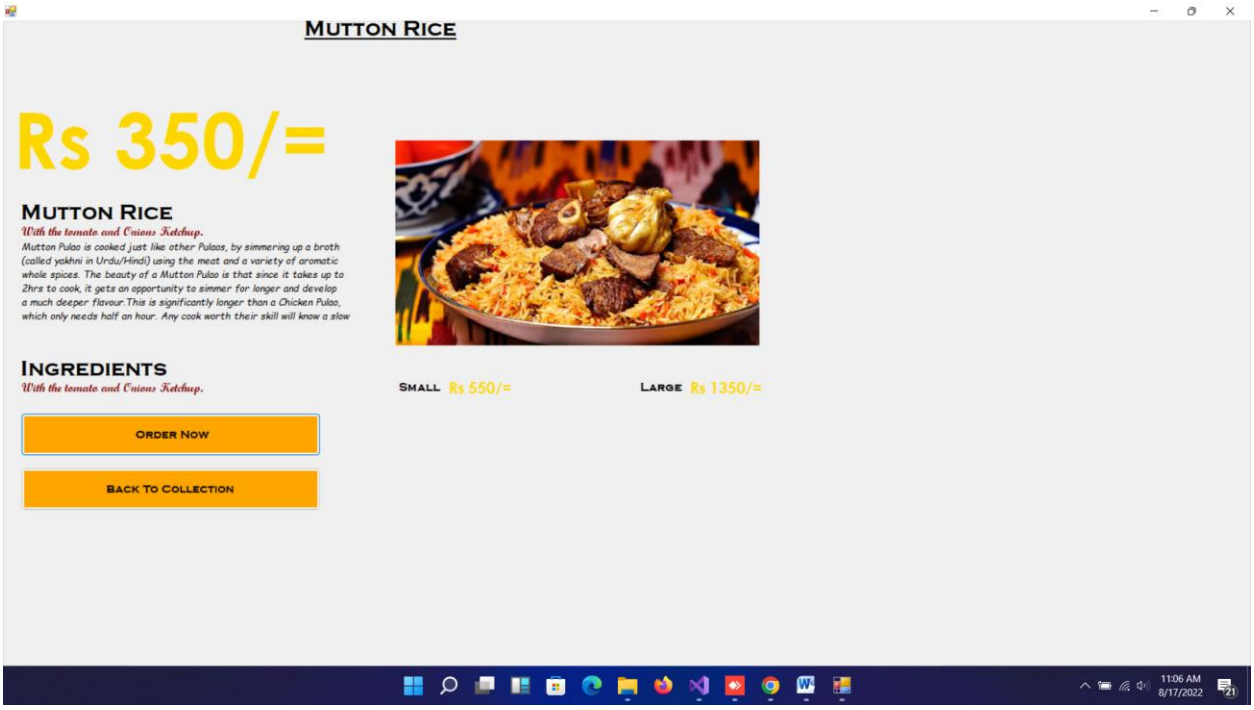


If the user click on the Register tab he will be assigned to this form and he the user can fill this form details and sign up for the application. We are validating the every fields and focus on filling all the fields .If all the fielda are filled then the user details will store in our database.

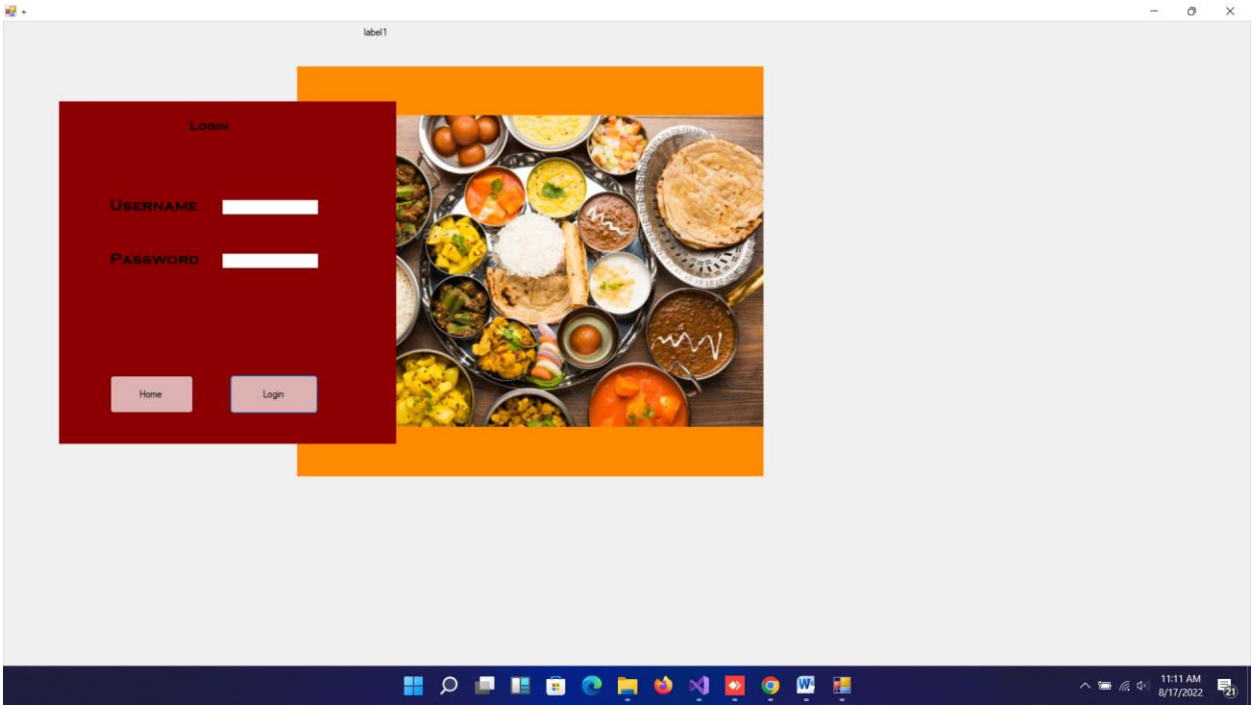
*if all the deails are filled correctly then the user will get an message “Data inserted successfully”



If the user select collection tab he can visit collection of the different dishes.

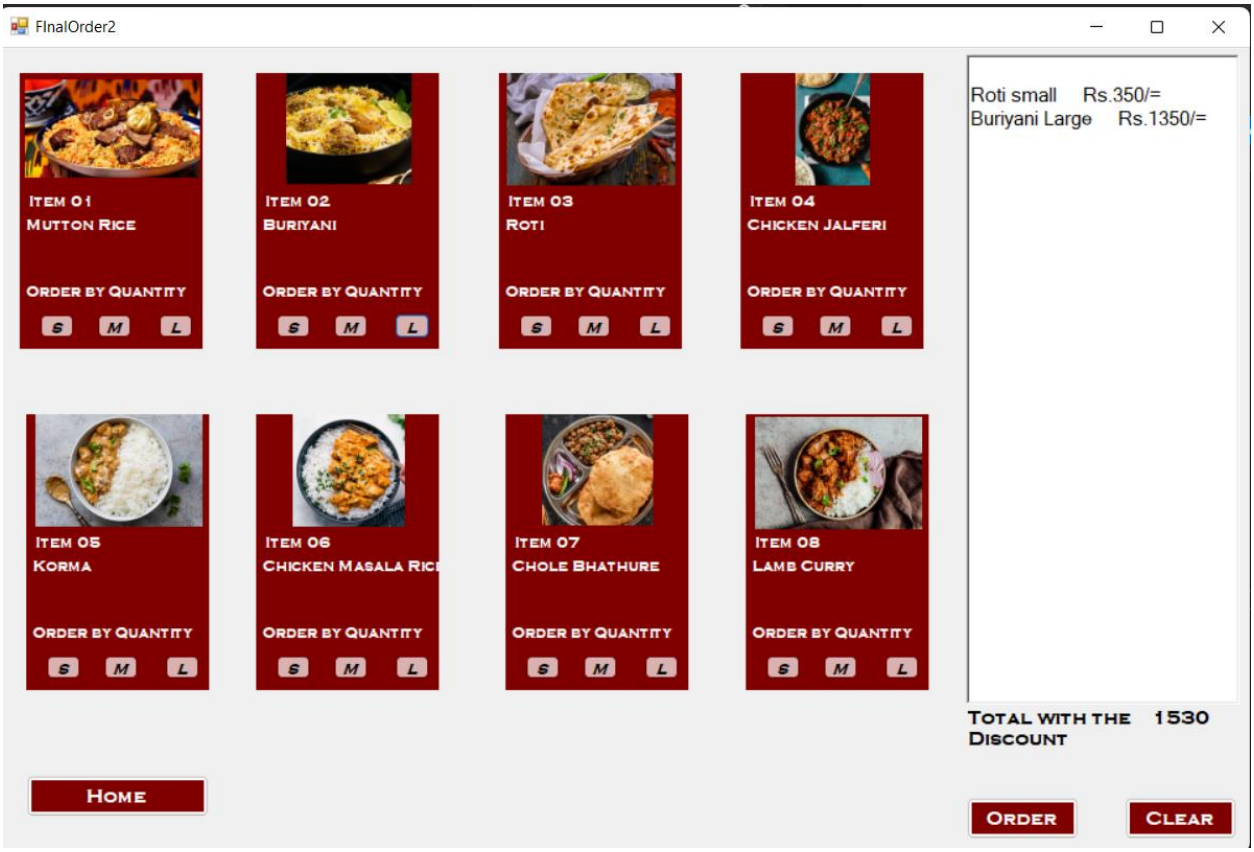


Imagine the user selected mutton rice so the user can see a description about it .and the user can read the description and make the order.



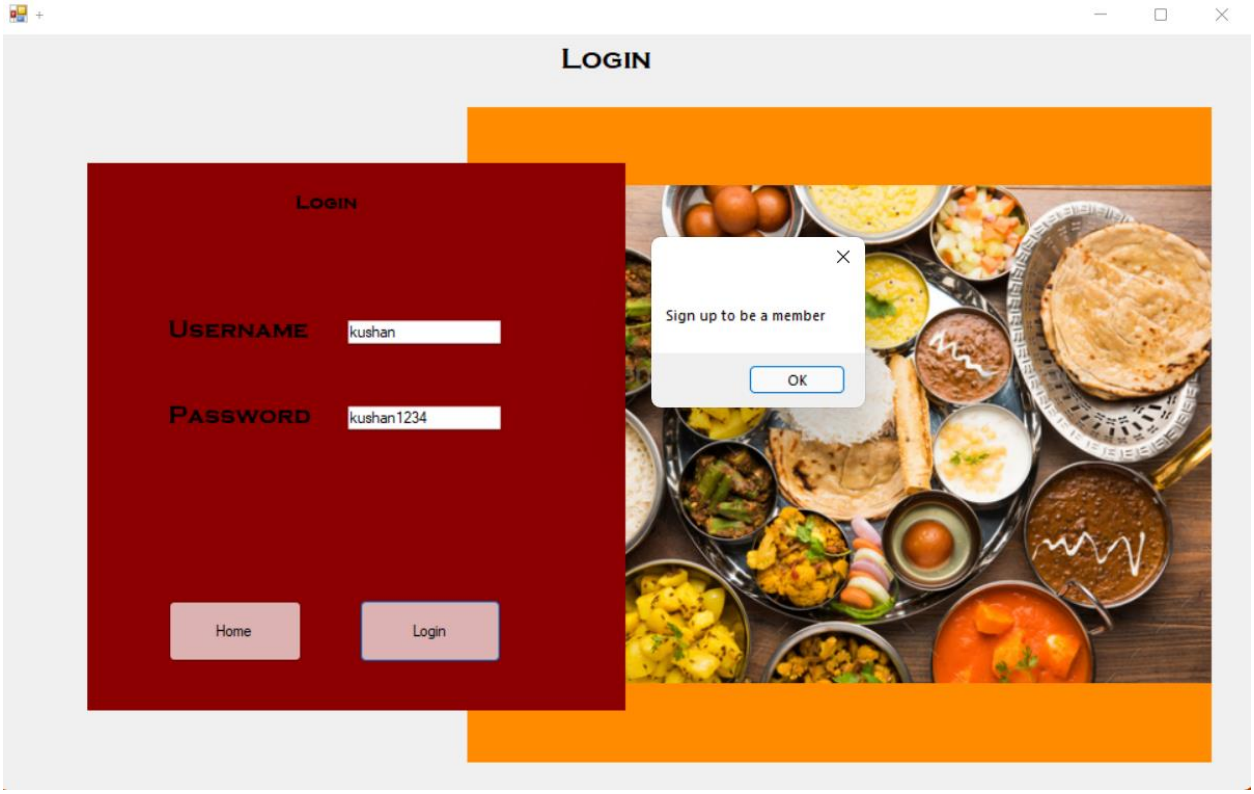
*when the user select Ordernow He will direct to this form he has to put his username and password.

*Then ths system will check whether the user is in the member table and if he's in the system he will direct to the final oreder page where the user can get 10% discount for every item he orders



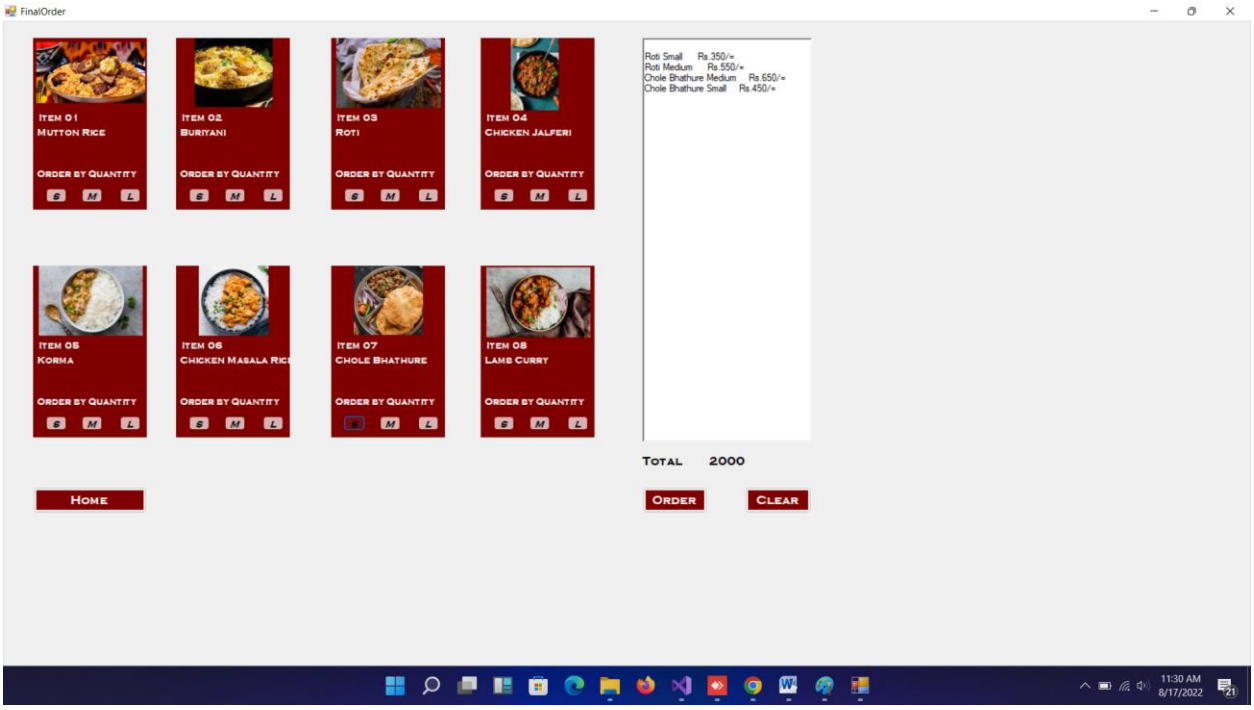
*Then the order can select any item he wants then the total will be calculated with the discount.

*If he wants to clear the added items he can click the clear button



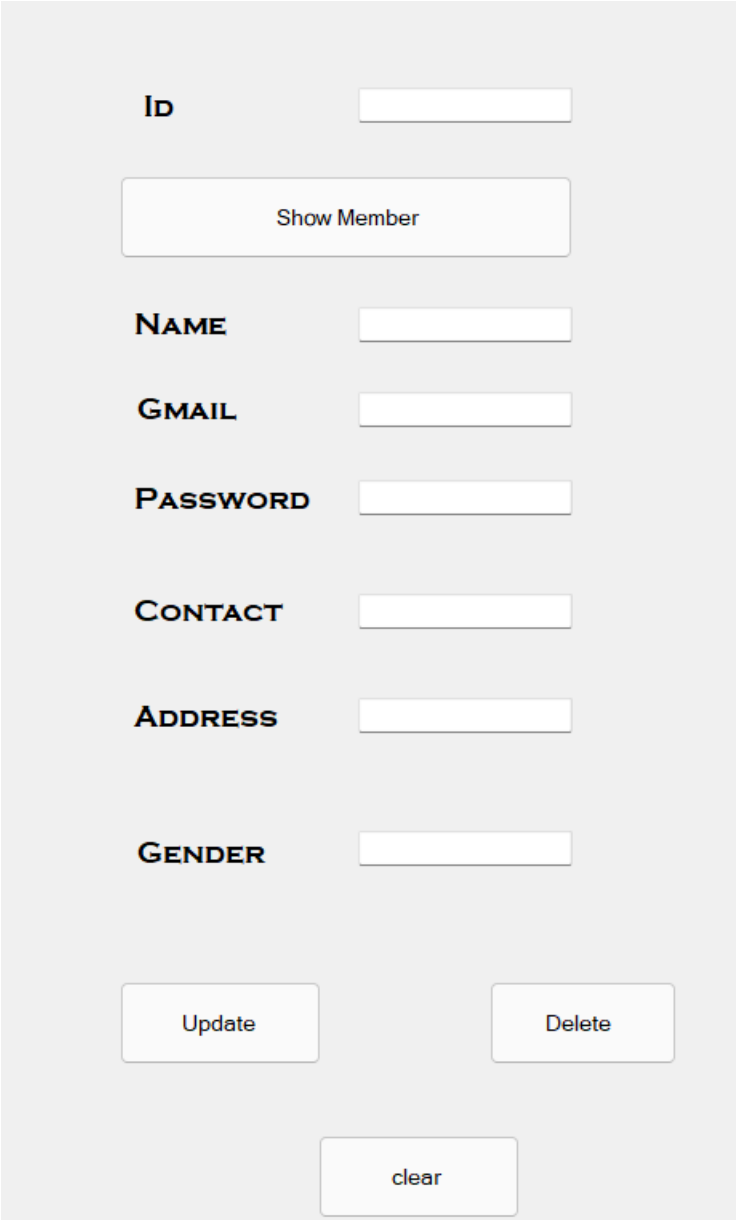
Imagine that you’r not a member in the system but you want to order some items using the application. So when you’r details are not In the system you will be assigned to the non-discount final order page. And not only that but also you will get a message called sign up to be a member .

You



You will direct to this page and you can order foods but you wan't get any discount.

By using CRUD operation we can view existing members.. and update the user-defined data and Delete the user entered data.



NHow the workload devided with the group Members

1)User interface design and planning-G.A.S Pankaja/RMKM Rathnayake

2)Back-end development-G.S.E Aponso/C.k Jayasinghe

3)Report and diagram making – T.H.A Nadeeshan

4)Dayabase connection –K.W.M.L Arunasiri

DFD Of the project

DFD

1. Customers can register in the database.
2. The customer details will be stored in the member database.
3. Once the customer is registered in our database, he will be a member so customers that are not members we call them as just customer our user-friendly purposes.
4. Member can make orders.
5. That order will store in the member order datastore.
6. Random people I mean customers can make orders too, they will store in random order data store.
7. The order will go to the kitchen, and they will prepare the meal.
8. The total will be calculated in the bill, and it will send to the customer by using online list and when the order is ready deliver the order to the needed address.
9. The customer will receive a bill.
10. We store the food ingredients list in our data store and by using it we can generate our reports.

11.Our manager will receive that report.
